

B Mean-preserving rectification

Informative proxy illustrated

Same population mean $\text{mean}_{t \in g}\, z(t) = \mu_g$

$$z_s = y_s - \beta(p_s - \bar{p}_g)$$

$$\bar{p}_g = \text{mean}_{t \in g}\, p(t)$$

β fixed before query

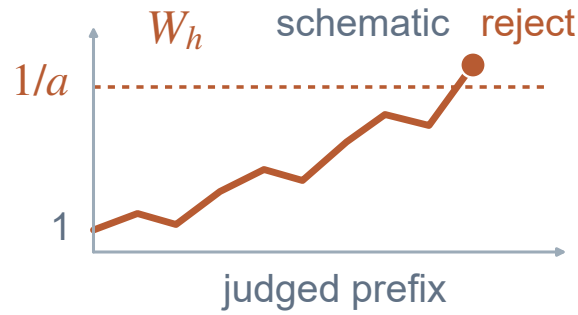

C Finite-population betting

$$\bar{x}_g \le \theta, \quad x_s = \pm z_s$$

$$m_s = \frac{N_g\theta - S_{s-1}}{N_g - s + 1}$$

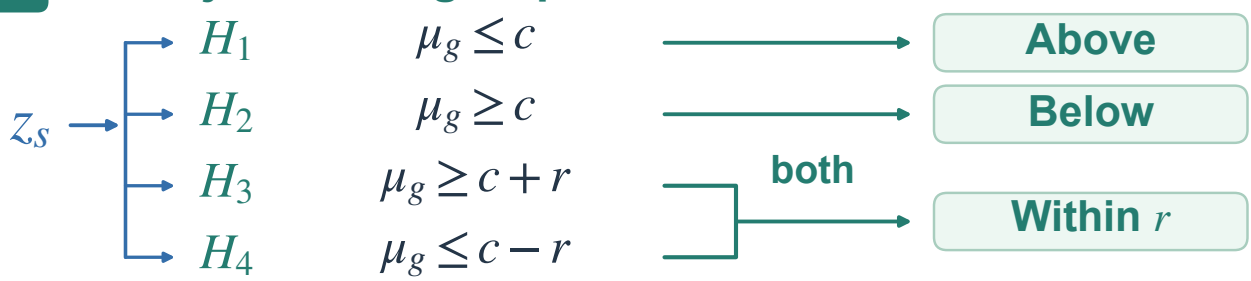

Past-based, capped λ_s

$$a = \alpha/(2K)$$

$$W_s = W_{s-1}\,[1 + \lambda_s(x_s - m_s)]$$

D On rejection → group decision

Certified → stop g Exhausted → exact side
